SUMMARY

Junior Backend Developer with ~2 years of hands-on experience across Java/Spring Boot and .NET/C#. Currently building core-banking microservices at Sacombank, across two platforms — CoreCD/CoreSL (certificate-of-deposit trading) and the MCS Bill System (virtual-account partner integration) — working with Saga orchestration, the Outbox pattern, idempotent APIs, Oracle, Redis, Kafka and IBM MQ. Designs and ships distributed systems end-to-end, including a personal multi-tenant notification platform. Comfortable with clean architecture, RESTful API design, CI/CD and containerized deployment, and committed to continuous learning.

SKILLS

Languages: Java, C#, JavaScript, SQL, HTML/CSS
Frameworks & Libraries: Spring Boot, Spring Cloud OpenFeign, ASP.NET Core, Dapper, ReactJS, Next.js
Databases: Oracle, PostgreSQL, SQL Server, Redis, MongoDB
Messaging & APIs: REST API, gRPC, IBM MQ/JMS, Apache Kafka, RabbitMQ
Tools & DevOps: Docker, Kubernetes, Helm, GitLab CI/CD, Apache Airflow, Kong, Git, Postman, Swagger
Soft Skills: Team coordination, problem-solving, self-learning

WORK EXPERIENCE

Backend Developer <i>Sacombank</i>	01/2026 – Present
CoreCD/CoreSL — Certificate-of-Deposit Trading Platform	
• Delivered production microservices covering the full certificate-of-deposit lifecycle — registration, issuance, primary/secondary trading, settlement — integrated with T24 Core Banking and PaymentHub. • Built the customer registration & lifecycle flow — corporate/retail buy-register with account and CIF validation, contract generation, and cancellation (with automatic sell-off of remaining holdings for retail). • Built the CD purchase flow end-to-end — dual-channel order intake (MQ + REST), buyer account verification, PaymentHub settlement, and automatic rollback on failure — using Saga orchestration with Redis-based idempotency for exactly-once processing. • Built the CD early-redemption and sell flow — multi-criteria pre-maturity sale simulation (full / partial / by-amount), interest & fee calculation, auto-sell below threshold, and settlement at maturity. • Designed Outbox-pattern event publishing in lot-management, automated CD-lot reconciliation/ODS sync with Apache Airflow DAGs, and built Redis-cached purchase/sale reporting.	
MCS Bill System — Virtual-Account Partner Integration Platform	
• Built the virtual-account (VA) integration platform — inquiry, deposit-notify, and outgoing-core flows unified behind a gRPC facade, with an IBM MQ request/reply layer dispatching to partner adapters and fallback routing to the legacy system for accounts outside the new platform. • Integrated 6 partner banks/payment gateways (SHB, LienVietPostBank, PVI, NganLuong, Vimo, GSM) through a common adapter layer, including OAuth2 token exchange and RSA-SHA256 request signing for SHB.	
Back-end Developer <i>Amazing Tech</i>	12/2023 – 05/2024
• Shipped API modules powering a tax-invoicing system and a water-factory management system, integrating external systems and cutting query latency with SQL Stored Procedures; built complex reporting modules with Excel export, partnering with the frontend team to define API contracts.	

PROJECTS

Notification Hub — Multi-tenant Notification Platform <i>Personal Project</i>	2025 – Present
• Designed and shipped a multi-tenant .NET 8 notification platform solo — Kong gateway, auth, ingestion (REST + gRPC + legacy AMQP), routing, templating, tracking, per-channel workers (email/SMS/push), and a Blazor admin console — architecture through infra. • Secured multi-tenant access by implementing OAuth2 client-credentials auth with RS256/JWKS, including zero-downtime signing-key rotation validated via a dual-key overlap window. • Built a reliable delivery pipeline (outbox-relay → Kafka → channel workers) with HMAC-signed delivery callbacks, end-to-end distributed tracing (OpenTelemetry, W3C trace-context across HTTP and Kafka), and circuit-breaker/retry/bulkhead resilience (Polly) with Redis fail-open caching.	
FEDOM-AI — Internal Exam & Proctor Management System <i>Capstone Project</i> <i>Back-end Developer</i>	2025
• Directed the backend architecture with a CQRS + MediatR Clean Architecture, then integrated a RAG-based Spring AI chatbot and SignalR real-time support; cut Excel-import processing off the request thread with an async RabbitMQ + Quartz-scheduled pipeline.	

EDUCATION

FPT University, HCM City	05/2025
Bachelor of Information Technology — Major: Software Engineering GPA: 7.92/10 (3.16/4)	

CERTIFICATIONS

• Software Development Lifecycle (Coursera) · Foundational C# with Microsoft (FreeCodeCamp) · Microsoft Back-End Developer (Coursera)
